Lancaster Farming

VOL. 12 NO. 28 | Lancaster Farming, Saturday, June 10, 1967 | $2 Per Year

TOBACCO PLANTING IS A FAMILY AFFAIR at the Robert Mylin farm, Willow Street R2. Seated on the planting rig are, from left: hired man Don Harnish; Donnie and Dale Mylin, ages eight and five, respectively; Mrs. Mylin. Robert Mylin is operating the tractor Bringing up the rear in their little red wagon are Dennis, three, and Debbie, one and a half L F Photo

Late Spring, But Tobacco Under Plastic Is Ready

by Don Timmons

How many muslin covered tobacco beds had field-ready plants by Memorial Day this year? We haven't heard of any as yet, but many plants grown under plastic-covered frames are already in the fields

This is the second time in as many springs that plastic covering has paid off for Robert Mylin of Willow Street R2 Although he started using the material three years ago, the wind destroyed any possible comparison that first season by ruining the plastic Then he relocated his beds in a more sheltered spot and has had great success with plastic-covered seedbeds ever since

In a normal spring there isn't much difference between plants grown under muslin and those grown under plastic. But when spring comes wet, late, and cold to Lancaster County, as it did this year, that's when plastic really pays.

Mylins generally plant eight acres of tobacco, with plants grown in four beds They found last year that they could get enough first-rate plants from only three beds when they used plastic covering But not all their plants are grown this way because they don't need all the plants ready at the same time For the past three years half the beds were covered with muslin and half with plastic This year the ratio was one muslin to two plastic

COMPARISON

Growing plants under both systems on the same farm gives a good comparison,

WHICH TOBACCO PLANTS would you pick? Those on the right are on their way to the field for planting, they were raised under plastic There is also a clump of plants in this grower's other hand, if you can see them; they were raised under the muslin, and will be returned to the beds to continue growing. Both groups were planted April 3rd The grower is Robert Mylin, Willow Street R2, and he is well-pleased with the results he has obtained growing plants under plastic during the past two years. L. F Photo

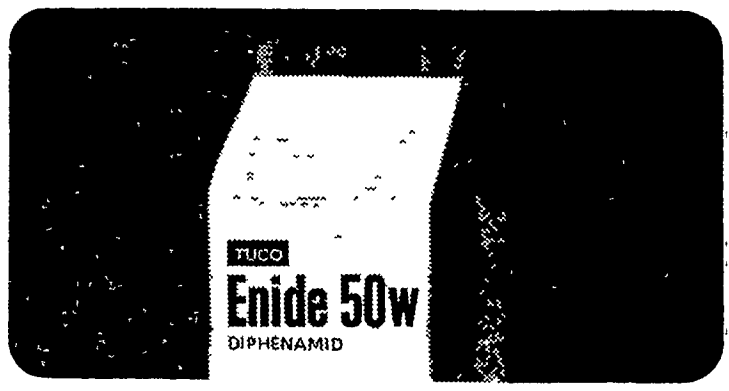
Get better weed control in your tobacco



use **Enide® 50w**

it stays mixed, won't clog

Enide is made different to work better. It's a 50% wettable powder that mixes easily, foams less and won't clog sprayers. It kills broadleaf weeds and grasses as they germinate. And one application gives up to a full season's control. You get cleaner fields with less cultivation. Harvesting is easier. Yields are higher.

"Plastic" Tobacco

No, that's not a new agricultural substitute product. But using plastic to cover tobacco seedbeds is a pretty good way to add a couple of weeks to your growing season.

We've reported for at least the last three years on farmers who have used this method successfully, and each year their number increases. In this issue, a Willow Street area farmer makes his second appearance in Lancaster Farming. For the past two years he has gained about two weeks in getting his plants to the field by growing them under plastic. And, according to John Yocum, superintendent at the Penn State University Field Research Station, ten days to two weeks is about the normal time advantage for tobacco plants grown under plastic instead of under the conventional muslin.

While some muslin-covered beds were reported transplanted this week, many are still not field-ready In the case of the Willow Street farmer and the state research station, plants under plastic were ready by Memorial Day

Yocum reports a new method is being tried at the station. Since plastic on a framework is at a disadvantage in windy locations: his staff is now placing the plastic flat, right over the seedbed This is then covered with muslin to hold it in place When the May weather gets too warm, the plastic can be removed by sliding it right out from under the muslin, leaving the latter in place until weather permits complete removal. One big advantage to this method, besides better wind resistance, is a labor-saving lack of watering Yocum reports that, after an initial watering, the job didn't have to be repeated until the plastic was removed. Next year he plans to experiment with sub-irrigation in the seedbeds.

While the method of growing tobacco plants under plastic undoubtedly requires more careful management than the old way, we think more farmers growing Lancaster County's multi-million dollar tobacco crop would do well to look into this faster method—especially if these cold, wet springs are going to become our normal weather pattern

Hunting A Job?

Many boys who graduated from Lancaster County High Schools this week are probably even now out hunting jobs, and some others will be looking for work just for the summer. What are your chances of finding what you're looking for?

Although Lancaster County is reportedly a job-deficit area with skilled help in demand by industry, your chances will be greatly affected by your appearance. If you think we're referring to your long hair, plastered down with that greasy kid stuff, you're right!

That hokey style may have been very much in while you were a schoolboy, but laddie, it is not going to do a thing for you when you are interviewed by a prospective employer — unless of course he's hiring a combo.

As a graduate, you will find success far more attainable in the working world it you dress and behave to please the adult crowd, not the in-school bunch. As a bonus you'll find you can see everyone else better, and, for a change, they can see you. So, come on out from under the thatch, boys; it's not bad out here in the light, really.

★ ★ ★ ★

Between The Stork And The Plow

The outcome of the foot-race being run these days in under-developed countries between the "stork and the plow", as one authority expressed it this week, is critical for the future of many peoples of the world With the pace being set by the swift flying stork, the tortoise-paced plow is running a very poor second

In some of these countries where food is scarce and starvation a daily visitor, seed grain is often consumed as food, and manure is burned for fuel rather than invested in the next crop Progress in educating such people agriculturally is slow

Regardless of personal or religious sentiments on the subject, if the food supply and population in under-developed countries is to be brought into balance, some means besides starvation will have to be used to slow down population expansion If highly developed agricultural countries are to help, and if those in need are to honestly accept that help, it is necessary that the stork's busy schedule be slowed That provides the best method we can see to give agricultural education a fighting chance to win the race

Fortunately, this line of reasoning seems to be becoming generally accepted by those close to the situation on both sides of the fence If that is so, agriculture may win this race yet

Weeds Reduce Soybean Yields

The cold weather this spring may force some farmers to replant soybeans which have failed to germinate If pre-plant incorporated herbicide has been applied, weeds should not be a problem when replanted If a preemergence herbicide was applied, replanting soybeans will incorporate the herbicide into the soil and probably lessen its effectiveness

Good weed control is a must for a high soybean yield Just a few weeds — one every 10 inches in the row — can reduce yields as much as 30 percent A band of morning-glories in a row may cut yields as much as 60 percent, according to Dr Richard Cole, chairman of the department of agronomy at the University of Delaware

Weeds take their toll by robbing the plant of moisture, food and sunlight, reducing stands and increasing lodging The common weeds affecting area soybean production include pigweed, lambsquarter, velvet weed, yellow foxtail, giant ragweed giant foxtail, morningglory, jimson weed, green foxtail and crabgrass

Weeds have their death grip on soybeans because the beans grow very slowly during their early stages The weeds can outgrow them and offer severe competition for water, food and light Cole says research shows that weed control is needed for the first eight weeks until the soybean plant can compete and keep weeds down A total weed control program should consider soil characteristics weed species present and the crops in rotation which dictate the type of weed control and the herbicide needed

Proper seed bed preparation is one of the best means of weed control By working the soil to start weeds growing and then working the surface to kill weeds that have started, weeds are killed before planting time A rotary hoe is also effective for controlling weeds in very young soybeans Shallow cultivation just deep enough to control weeds, but not deep enough to bring buried seed to the surface to cause trouble later on, is also recommended

Weather

Generally warm weather is called for right through the weekend. Although it will be cooler on Tuesday and Wednesday, temperatures during the five-day period, Saturday through Wednesday, are expected to average above the normal 82 to 59 degree range.

And some needed moisture is anticipated during the period also, with showers Sunday and Wednesday expected to yield ½-inch, or more.

ONE USDA EMPLOYEE FOR EVERY 15 FARMERS IN US

The USDA resources are formidable, says AFBF president Charles Shuman While farm numbers have steadily decreased, USDA employees have increased There is now one USDA employee for every 15 farmers in the nation, and the USDA spends $8 9 million a year for publicity and reports, Shuman charges

"However, with all these resources I don't think the Administration will be able to quiet the growing revolt on the farm against the outmoded and wasteful federal farm programs which have driven the parity ratio to the depression low of 1934

(The parity ratio shows the relationship between the prices farmers receive and the price of items purchased for production)

THE BIBLE SPEAKS

Internat onal Un form Sunday School Lessons

BY LAWRENCE W. ALTHOUSE

No, Lord!

Lesson for June 11, 1967

Background Scripture Acts 9 32 through 11 18.
Devotional Reading Acts 10 1 4 1

Several months ago, while attending a meeting in Dallas, I had a chance conversation with a man who obviously wanted very much to talk with someone. We were sitting at neighboring tables in a restaurant. I'm not sure how the conversation began, but we hadn't talked for more than a few minutes until he was unburdening himself of something that apparently troubled him very deeply.

Rev. Althouse

He was an engineer, a civil engineer with a master's degree, to be exact. He had just started a new job that day, but it was his previous job, the job he had just left, that bothered him Weeks ago, he had been approached by a firm that offered him a substantial raise in salary Desiring to be fair with his present employer, he informed his employer that he was contemplating the offer and asked whether he might want to consider meeting it

"I Don't Understand"

His employer refused, saying "I know that other engineers o your ability are getting that much and more, but it is more than enough for an Indian!" With that, the employer began an abusiv tirade, demeaning the man and his race The engineer was a highly competent man, but because he was an American Indian, his employer could not fully treat him as an equal human being. "I don't understand," the man at the next table kept saying I worked for him twelve years and he never called me a d——d dirty Indian before!"

This incident just happened to occur in Dallas The man across from me might just as easily been a Puerto Rican in New York City, a Negro in Philadelphia, or a Mexican in San Diego. Or — and this is hard for me to admit — it might have happened in the little town where I live or the county-seat metropolis nearby.

This is not a new problem in the world. The New Testament recalls for us the wall that stood between Jew and Gentile. It was a wall so great that Peter refused to have anything to do with Gentile converts to Christ. So strong was the heritage of prejudice in Peter that he responded with an outright refusal: "No, Lord!"

To Avoid Corruption

The barrier between Jew and Gentile (and we must remember that at that time the followers of Jesus still regarded themselves as Jews) seemed reasonable enough. Throughout the history of the Hebrew people there had been a constant and obvious temptation to adopt the pagan (Gentile) religious practices of their neighbors. Time and again the Lord sent his prophets to warn the people to give up their Gentile ways and worship him alone. The Hebrew people, therefore, learned to avoid all contact with Gentiles in order to avoid being corrupted by pagan influences. It began as a "reasonable" idea. In time, however, it developed into prejudice and racial pride. It was carried to the usual human extremes.

Peter said, "No, Lord!" It was rare for Peter to defy his Lord's wishes. So it is today. If we are going to say, "No, Lord!", it is more than likely that it will be over some issue of pride and prejudice. He shows us clearly what is his will for society and we respond, saying: "No, Lord, I don't mind 'them' having equal rights, so long as they don't get 'uppity.'" "No, Lord, I'm not prejudiced, you know, but I don't have to have 'them' in my home, do I?" "No, Lord, our property values will plunge." "No, Lord, you don't know them as we do." "No, Lord" . . . (and you fill in the rest).

Insulting The Creator

What the Master said to Peter, however, he says also to us: "What God has cleansed, you must not call common." When we demean any of God's creatures — and he created them all, didn't he? — it is an insult to the Creator, not the creature. It was hard for Peter to rise above his prejudice, but he did it and so must we: "Who was I that I could withstand Jesus Christ?" Let our "No" become "Yes!"

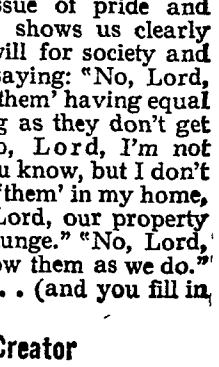
(Based on outlines copyrighted by the Division of Christian Education, National Council of the Churches of Christ in the U. S. A. Released by Community Press Service.)

Now Is The Time . . .

By Max Smith, Lancaster County Agent

To Provide Shade

Protection from the hot, summer sun is very important for most efficient production from all kinds of livestock If trees are not present in the area, then artificial shade should be provided Most all research work indicates that direct sunlight at all times in this part of the country will reduce gain in weight as well as milk production A temporary roof with open sides will give protection and plenty of cross-ventilation



SMITH

To Control Flies

Fly control starts with a good sanitation program supplemented by an insecticide spray program Breeding places should be removed and not allowed to exist It is suggested that various fly sprays be used from year to year to reduce the danger of building fly resistance Some alternating from application to application during the same season using two or more insecticides might also improve the control

To Be Alert For Wood Ticks

Lancaster countians living working or playing near wooded areas should be on the alert for wood tick infestations They seem to be more plentiful this spring These eight-legged ticks bury their heads in human flesh and could be the start of several infections. Parents are urged to inspect their youngsters carefully and remove the tick carefully followed by use of antiseptics. The preventative measures include spraying playgrounds or areas with DDT, Sevin, or Lindane

ment (25 points), with judges to be named at a later date. The deadline for entries will be July 1st, the board noted. Any eligible girls interested in representing Lancaster County's $30-million poultry industry, and in competing for the state title, are advised to contact county poultry association secretary Mrs Paul F McGarvey, 379 West Roseville Rd, Lancaster, for application blanks

The reigning Lancaster County Poultry Queen is Lilli Ann Wivell of Columbia R1.

DITHANE M-45® takes sides. Your side. This photo shows potato foliage with one half protected by **DITHANE M-45;** the right half was not sprayed Both sides were inoculated with late blight fungus. Blight infected the unprotected side, but the left side protected with **DITHANE M-45** stopped the fungus growth.

DITHANE M-45, a chemically unique fungicide, is effective against both early and late blight of potatoes. It can be applied in high or low volume ground sprays or in aerial sprays. **DITHANE M-45** clings to the foliage and remains on the leaf surface and resists rain or irrigation Apply every 7 or 10 days throughout the season Use early applications of 1 lb of **DITHANE M-45** per acre and increase to 2 lbs as vines increase in size Follow detailed label instructions. Then harvest a record crop of top grade potatoes. See your dealer or write for full information.

● Plastic Tobacco

(Continued from Page 1)

with any differences in growth rates immediately evident. Mylin started planting tobacco on June 1st. this year, but said that plants in his plastic-covered beds were ready to go by May 30th.

This reporter observed early this week that while leaves on Mylin's plants grown under muslin were the size of silver dollars, the plants were only a couple of inches tall. Tobacco grown under plastic, however, had leaves as big as dollar bills, and plants measured at least six inches in height.

THE WOMAN'S TOUCH

It has often been noted that when it comes to raising baby chicks, or other young stock, no one seems to do as good a job as a woman Apparently the same thing applies to growing tobacco plants At Mylin's, it's Robert's wife Mary who tends the seedbeds once they are planted

There seems to be a bit more management involved in growing plants under plastic Temperature control for instance, is critical A thermometer hanging under the plastic dome gives Mrs Mylin an indication of how to handle the ventilation. When the temperature hits 110 degrees she generally ventilates the beds by opening the plastic covering at the ends or by removing tape from one-foot-long air slits located either side of the plastic dome A certain amount of judgment is necessary in hitting the right balance between ventilating properly and overventilating The wind direction and velocity, and the outside air temperature are all factors to be considered.

WATERING

One of the drawbacks Mrs. Mylin notes in caring for the plants under plastic is the difficulty in getting water distributed properly. Once the plants are well-started this is only a once-a-week job, but to get them going requires daily watering. This is done through the ventilation slits. Mrs. Mylin says she is still looking for a more efficient way to get this important job done.

TREATMENT

All three tobacco beds were seeded at Mylin's on April 3rd. This was nearly three weeks later than last year because of the poor weather conditions. The only fertilizer used on the beds was some ammonium nitrate when the plants were large enough to benefit from it

About two weeks ago, when the weather was beginning to warm up, the plastic and muslin covers were removed permanently For two weeks before that they were removed during the morning, covered at noon, and then, gradually, left off all night to harden the plants

Mylin has stuck with the same varieties of tobacco for the past few years He planted two beds of Pennbel-69 this year, one under plastic and one under muslin, and one bed of Hill Island

When planting in the fields, Mylin adds start-and-grow fertilizer to the planting water, and also chlordane to kill cutworms. He uses a Holland tobacco planter which he picked up at a sale last year, and notes that it operates so handily his eight-year-old son can help feed the plants into the planter with no trouble.

The Mylin's hired man is Don Harnish of Willow Street R2, a senior in vocational agriculture at Penn Manor High School Harnish farms two of Mylin's tobacco acres on the halves.

Mylin cites one mistake he made this year when he ordered his plastic. Instead of getting 6-mil thick material, he accidentally bought a lighter weight 4-mil plastic It suffered somewhat more wind damage than the heavier material he had the previous year.

Scientists Seek Ways To Destroy DDT In Soil

Anaerobic bacteria — mirco-organisms that live without air — may provide a way to reduce DDT accumulations in the soil.

The principle of anaerobic decomposition has been applied for many years by builders of septic tanks. The indication that it may also work on DDT suggests a solution to one of the most vexing problems concerning DDT — its persistence. Once released into the environment, DDT retains its toxic qualities for years, and it is almost sure to build up in the soils where it is used every year.

Soil scientists W. D. Guenzi and chemist W. E. Beard at the ARS Nitrogen Laboratory, Ft. Collins, Colo., treated soil samples with DDT and incubated the samples in an airtight chamber to promote growth of anaerobic micro-organisms.

After four weeks in the incubated soil, less than half of the applied DDT remained in its original form. The scientists also applied DDT to soil samples that had been sterilized to free them of all micro-organisms. In these samples, DDT remained intact throughout the four-week test period.

Most of the DDT was converted directly to DDD, a less toxic material. The scientists pointed out, however, that their experiment is only one step toward decomposition of DDT.

If they can decompose DDT anaerobically in the laboratory, their next step will be to develop ways of creating anaerobic conditions in the field. This might be done by flooding the land, thus sealing it off from contact with air and permitting anaerobic populations to flourish.

In the tests, Guenzi and Beard added .1 milligram of DDT to each 10-gram soil sample. The soil samples were moistened and incubated at 30 degrees centigrade in an atmosphere of 20 percent carbon dioxide and 80 percent nitrogen. Radioactive DDT was added to the soil so that DDT and its decomposition products could be identified by a scintillation counter. After two weeks of incubation, 88 percent of the DDT remained in the soil samples; after four weeks, 34 percent.

Adequate Water Supply Vital To World Order

The Administrator of the United States Department of Agriculture's Soil Conservation Service, Dr. Donald A. Williams, recently told delegates to the International Conference on Water for Peace in Washington, D.C., that an adequate water supply is essential to a stable world order.

"Vast fresh water resources wait to be tapped," Williams said. "They include the water supply that flows unused or under-used to the sea; the water supply that is lost through evaporation from reservoirs; the waters that are so badly polluted that they cannot be used; the great store of water under the ground; and the water that is available for reuse when it is properly treated before it is returned to the stream."

In describing the contribution of water to economic stability, agricultural sufficiency, and prosperity and progress, Williams stressed the need for cooperation among nations to assure adequate water supplies.

"The United States Department of Agriculture is training foreign agricultural workers in our colleges and universities as well as in Washington. We are sending trained technicians abroad to help teach other peoples to carry out their own agricultural research, and to extend the knowledge required for modern agricultural development to the farming communities," he said.

"But there must exist a true partnership between the aid-giving and the aid-receiving nations. It must be a close partnership in which the relative responsibilities are clearly understood," Williams noted.

Williams cautioned that while advancing technology in the United States will help other countries develop their soil and water resources, "technological development is a gradual, long-term proposition that makes heavy demands upon a nation's people and institutions. We make a mistake if a technology is introduced too far ahead of the ability of the local people to apply it," he said.

He expressed confidence that, as partners, the community of nations can win the victory over starvation and want.

KEEP PESTICIDE RECORDS

Two new pesticide record forms are now available from the county extension office, according to associate county agent Victor Plastow.

These forms, which will give farmers a permanent record of their pesticide applications — both on livestock and on crops —will be good insurance, Plastow notes, in clearing a farmer if he should ever get involved with any of the government agencies that are constantly checking for chemical contamination of agricultural products.

Whenever you want a person to tell you how smart you are first tell him how wonderful he is.

SEQUOIA RIDERS MEET

by Susan Alleman, reporter

On Tuesday, May 16, the monthly meeting of The Sequoia Riders was held at the Melvin Ressler home.

The first half of the meeting was held outside. Practice in mounting and dismounting was held as a followup to the film "Youth and the Quarter Horse", which was shown at the last meeting.

John Kurtz presided over the second half of the meeting during which business was conducted. On June 17, at 2 p m., the next meeting will be held with Lewis Sauter giving a demonstration on Fitting and Showmanship

On June 24 the club will hold eliminations for the county 4-H Horse Show Time and place for that activity will be announced later.

SEWING-COOKING CLUB ELECTS L. BRACKBILL

by Joyce Stoltzfus, reporter

At a recent meeting of the newly formed Gap-Intercourse 4-H Sewing and Cooking Club, Lucinda Brackbill, daughter of Mr and Mrs Nelson Brackbill, was elected president

Taking charge of the reorganization were Mrs Charles Hoober and Mrs Ed Mull, two adult leaders.

The following members were elected to fulfill an office for the year. Doris Kauffman, vice president, Jane Hoober, secretary; Donna Denlinger, treasurer; Debbie Gifford and Karen Waldrop, game leaders; Eileen Rohrer and Beth Ranck, song leaders; Joyce Stoltzfus, news reporter; and County Council Representatives, Janice Baum and Lucinda Brackbill

Those enrolled in the Teen Leadership Project are: Evelyn Huyatt, Donna Denlinger, Janice Baum, and Joyce Stoltzfus.

Record Books were handed out and two demonstrations were given on Sewing Boxes and Materials and Fabrics by Evelyn Huyatt and Debbie Gifford.

The next meeting will be on June 12, at the Pequea Valley High School at 1 p m.

Rise In Meat Animal Prices Raises Index

Substantial increases in the prices received by farmers for livestock and livestock products more than offset declining crop prices to push the May index of prices received up four points (two percent), according to the Pennsylvania Crop Reporting Service. The largest gain was registered by meat animals, which averaged 10 percent above the previous month.

All meat animal values were up, with hog prices showing the largest gain. The mid-month average of $21.50 per cwt. was $3.50 higher than the previous month. Other major gainers included calves and lambs, each up $2.00 per cwt., to $33.00 and $26.00 respectively. Steers and heifers and slaughter cows were up 60 cents, and sheep gained 70 cents. Milk price increased a dime to $5.45 per cwt.

Crop prices were mostly lower, as wheat dropped a nickel, corn was off three cents and soybeans down a penny. Barley, at $1.14 was up a cent, and rye at $1.18 was three cents higher. Hay prices dropped 50 cents per ton.

The index of poultry and egg prices was down slightly as a result of a ½ cent drop in broilers and roasters. Farm chicken and egg prices were both unchanged at 12 cents and 33 cents respectively.

The index of prices received, which is a measure of the change of prices received by farmers, was 252 percent of its 1910-14=100 percent base. This compares with 248 a month earlier and 245 a year ago.

Slander is like coal — some rubs off on everybody who handles it.

GET RID OF

APHIDS, FLEA BEETLES and

COLORADO POTATO

BEETLES

On Potatoes

Ask us about

Phosphamidon

Phosphamidon actually hunts pests down on potato plants. It kills them wherever they're hiding — under the curl of a leaf — in the crevice of a stalk.

This is because Phosphamidon doesn't kill by contact alone It's absorbed by the foliage and goes through the entire upper part of the plant system. That means it kills hidden insects other sprays miss. Phosphamidon gets rid of Colorado potato beetles, (even the resistant ones) — as well as flea beetles, leaf hoppers and all four kinds of aphids that attack potatoes.

Phosphamidom is absorbed quickly, too, so workers can enter the fields just a few hours after spraying. Why take chances on missing any potato pests. See us now for ORTHO Phosphamidon.

Cooperative State Soil Survey To Continue

Officials of three agencies, meeting at Penn State University, signed a revised memorandum of understanding recently to continue a statewide soil survey. The agencies are the Soil Conservation Service of the U. S. Department of Agriculture, the Pennsylvania Department of Agriculture, and the College of Agriculture at Penn State.

Information from the cooperative soil surveys is used as a guide by county and regional engineers, according to Ivan McKeever, state conservationist of the U.S. Soil Conservation Service, Harrisburg, and Russell E. Larson, dean of the College of Agriculture.

In addition to Larson and McKeever, officials signing the memorandum included Leland H. Bull, State Secretary of Agriculture; Dr. M. A. Farrell, director of the Agricultural Experiment Station at Penn State; and Thomas H. Patton, director of the Cooperative Extension Service at Penn State.

To date, some 16 million acres have been surveyed by the Soil Conservation Service in Pennsylvania, McKeever pointed out. He added that scientists are mapping 1 5 million acres annually in the state and are currently surveying soil in 34 counties

Completed soil survey reports have now been published, featuring maps, for 14 counties. The counties are Carbon, Chester, Clarion, Clinton, Delaware, Erie, Jefferson, Lancaster, Lehigh, Montour, Northumberland, Potter, Union, and York.

Farm Women No. 1 Plan July 8 Outing

The Society of Farm Women 1 will hold a family covered dish picnic at the pavilion at the Muddy Creek Church of the Brethren on July 8 at 6 30 p m

Three new members were accepted by the Society at their meeting held on June 3 at the home of Mrs Daniel Brubaker They are Mrs Paul Kurtz, Mrs Noah Kreider and Mrs Raymond Groff, Jr

Mrs Roy Brubaker, president, presided at the meeting. Mrs V Scott Garman presented the devotions and Mrs Daniel Brubaker was the song leader The women answered the roll call by mentioning where they had spent their honeymoons Kenneth Brubaker sang several selections. Guest speaker was Leslie A. Toon, Neffsville, who spoke on the subject, "My Friend, the Honey Bee"

WHY WOMEN WORK

Women work to earn money for themselve and their families One survey indicated that more than 90 percent of women workers who live with their families contributed regularly to meet family expenses Well over 50 percent considered themselves responsible to some degree for support of other family members

PROTEINS IN MEAT

Meat proteins are readily digested and easily assimilated, says Louise Hamilton, extension foods and nutrition specialist Proteins supply the necessary amino acids in just the right proportions for the body to use

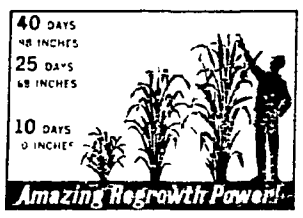
AMAZING! TREMENDOUS! MIRACULOUS!

For Pasture
For Hay/Haylage
For Green Chop
For Cover or Plow-Down

Strong words—yes! But it takes strong words to describe Agriculture's latest "miracle" crop —DeKalb Sudax Brand, the *original* Sorghum-Sudangrass Hybrids These summer forages have about everything the dairy or livestock man could want in a forage crop In test after test, they have out-yielded standard Sudangrass by 35-50%. Extremely tolerant to drouth, Sudax Brand Hybrids can be grown most anywhere They are leafy tasty, high in feed value, and very versatile Get the MOST from your feed acreage—plant DeKalb Sudax Brand Hybrids



Miracle Crop of the Century

New Land Resources Map Features 153 Soil Groups For Pennsylvania

Pennsylvania has a new Land Resources Map, unlike anything published previously for the State. The map features 153 land resource units or soil groups, each representing a different level of soil productivity. Developed by the Agricultural Experiment Station at Penn State University, the map uses multiple colors, coded and symbolized for identification, to depict soil groups.

The first of its type and quality for Pennsylvania, the map is a highly condensed, graphic presentation of land resources, according to Howard W. Higbee, retired professor of soil technology at Penn State who produced it Higbee says the map will be vital for soil and water resource managers and for industrial and community planners

The Land Resources Map integrates soils, geology, and land use from the standpoint of inherent productive capacities of soils, Higbee points out. Copies are available for $10.00 by writing to Maps, Box 6,000, University Park, Pa, 16802

Each soil unit is evaluated by 16 characteristics. The more important ones are soil depth, soil drainage environment, geologic source of soil material, soil permeability, plant rooting zones, and dominant crop production.

A stream map was made as a base unit in the preparation of the Land Resources May two years ago. The stream map has been distributed widely throughout the Commonwealth among fishermen, hunters and campers

● Eastern Milk

(Continued from Page 1)

conference room of the market administrator, 205 East 42nd Street, New York

The orders involved are the Massachusetts-Rhode Island, New York-New Jersey, Washington, D C., Delaware Valley, Connecticut, and Upper Chesapeake Bay federal orders.

The hearing was requested by milk dealers and several cooperative associations in the New York-New Jersey market, after which, at USDA's invitation, several more proposals were submitted by interested persons in some of the other order areas.

The proposals, in general, would set an upper limit on the level of surplus prices provided under present pricing formulas in each of the orders. One proposal would raise the manufacturing milk (Class II) price level by providing that it be not less than one dollar below the fluid milk (Class I) price.

The proposals also include the request that if final action cannot be taken by July 1, temporary relief be granted either through a suspension action, or a temporary amendment.

After considering evidence presented at the hearing, USDA may recommend amending the order Before the changes would be made effective, it would be necessary for at least two thirds of the dairy farmers serving each of the areas to approve

Here's What JOHN M. NISSLEY

Route No. 1, Bainbridge

Has to Say About

WAYNE CATTLE WORMER

"I was particularly pleased with the success I had with Wayne Cattle Wormer. It has convinced me that if an animal has worms, it can be held back in growth, appearance and general health more than most of us realize

"Late last summer I noticed one of my dairy heifers was rather unthrifty and lacking considerably in size, hair coat appearance and general health, compared with the rest of the heifers it was with on pasture

I was told by my feed dealer Grubb Supply Co, Elizabethtown, that these Heifers probably had cattle roundworms, so I decided to worm them with Wayne Cattle Wormer.

"In a matter of several weeks after they were wormed the poor doing heifer was rapidly 'catching up' with the rest of the group and looked every bit as good and in some respects had a slight edge on the rest of the heifers which also improved in appearance when they were brought in off pasture late this fall

'I also use Wayne 32% Dairy Krums for my milking ration"

John M Nissley

Awards Presented To Outstanding Seniors

Annually the outstanding senior student in each of the county s nine vocational agriculture departments is recog nized with an appropriate award This may be the De Kalb Award a certificate of agricultural accomplishment based on scholarship, leadership and supervised programs in agriculture or the award may come in some other form this varies from school to school

Of this year's outstanding seniors in Agriculture, three plan to continue their education, one will enter a non-agricultural business, and five plan to go into farming.

Six of the outstanding boys are holders of the Keystone Degree, the highest state-level FFA award Most of them have served their local FFA chapters and several have held offices at the county level In most cases recognition was made of these outstanding seniors at their respective graduations and awards assemblies but a few received their honors at the annual parent-son banquets held by each chapter

The nine outstanding seniors and their schools are

J. Richard Thomas — Penn Manor Dick received the DeKalb Award at the FFA banquet April 7 He was also presented with the Manor View Dairy Award, which goes to the outstanding senior in agriculture, at his high schools' commencement exercises Thursday night Dick is the son of Mr and Mrs John Thomas, Millersville R1 and is a Keystone Degree holder He plans to attend Penn State University in the fall to major in dairy science His college plans were helped along recently when he was named as one of six winners of $300 Lancaster County Farm & Home Foundation scholarships

Robert Weaver — Lampeter-Strasburg Bob has probably earned more local and county FFA honors than any other graduating senior He has served as president of his local chapter and of the county chapter and was recognized as the 1966 County Star Farmer He also holds the Keystone Degree and was recently presented with the DeKalb Award. The son of Mr and Mrs Ivan Weaver of Strasburg R1, Bob plans to go directly into farming as a career

Daryl Bollinger — Ephrata. Daryl was selected for the DeKalb Award in recognition of his outstanding FFA efforts. He was this years president of his local chapter and served as delegate to the county chapter He was first runner-up in the competition for County Star Farmer in 1966, and has been outstanding in showing his Holsteins at local and district levels. His farming program at Ephrata in-

Prune In June, Specialist Says

The best time to prune evergreens is during the month of June after the first new growth is finished according to Robert F Stevens extension horticulturist at the University of Delaware

If pine trees are pruned each year, they will remain compact and still keep then characteris tic shape They should be pruned when the new shoots called candles are fully elongated but still tender and succulent At this time the new needles are about one half as long as the previous year's needles The new growth can be cut back one-third to one half its length a new set of buds will form just below the cut surface

Yews, juniper and cedar trees

Add Variety, Flavor and Appearance With Lemon Juice

SPENCE

The tangy flavor of lemon juice enhances almost any dish, from pies to meats to beverages Common lemons can be used in many ways

Lemon juice will help prevent browning of fresh cut fruits such as peaches, apples, pears and bananas Either dip the fruit in the juice or pour the juice over the fruit.

Potatoes will stay white if they are cooked in water to which a little lemon juice is added. For best results, add the juice halfway through the cooking period and don't use too much juice or the potatoes will harden.

To flavor vegetables, lemon juice should be added just before serving Don't cook green vegetables with lemon juice The acid in the juice will turn the vegetables an unattractive olive green and they will have to cook longer to become tender

Remember to measure the amount of juice accurately when using lemon juice in recipes To prevent curdling in recipes that call for lemon juice and milk, add the juice to the milk, not the milk to the juice

Lemon juice is available in many forms The best juice still comes from fresh fruit, but the juice in bottles is also very good Frozen juice is also generally of high quality.

Fresh lemon juice really gives a lift to muffins—as you will see if you try the following recipe

FRESH LEMON MUFFINS

- 2 lemons
- 1 cup unsifted flour
- 1 teaspoon baking powder
- ¼ teaspoon salt
- ½ cup butter or margarine
- ½ cup sugar
- 2 eggs, separated
- 2 tablespoons sugar
- ¼ teaspoon cinnamon

Grate lemon peel to yield 1 tablespoon peel, ream lemons to yield 3 tablespoons juice, set aside Sift together flour, baking powder, and salt Cream butter thoroughly; gradually add sugar, beating until light and fluffy Beat egg yolks until lemon colored, add to butter-sugar mixture, blending well Add flour mixture alternately with lemon juice Do not overmix Beat egg whites until stiff, but not dry. Carefully fold whites and grated lemon peel into batter. Fill lightly greased muffin pan ⅔ full Combine sugar and cinnamon; mix well and sprinkle about ½ teaspoon over each muffin. Bake at 375 degrees, about 25 minutes, or until done. Excellent served as an accompaniment for salads—particularly fruit salads Also serve leftover muffins, halved, toasted and buttered Makes 10 2½ inch muffins.

* * * *

HEAVENLY LEMON TORTE

- 1 cup sifted enriched flour
- ¼ teaspoon salt
- 6 egg whites
- 1 cup sugar
- 6 egg yolks
- 1 teaspoon grated lemon rind
- 1 tablespoon lemon juice

Filling and Frosting

Sift together flour and salt. Beat egg whites until foamy. Beat in sugar, 2 tablespoons at a time, until shiny peaks form; set aside. Beat egg yolks until thick and lemon-colored; blend in lemon rind and juice. Fold into beaten egg whites. Sift flour mixture ¼ cup at a time, over egg mixture, folding in gently after each addition. Turn into ungreased 9-inch tube pan. Bake in preheated 375 degree oven, 40-45 minutes, or until cake springs back when lightly touched. Invert pan and cool completely before removing cake

FILLING AND FROSTING

- 1 package (3-¾ oz) instant lemon pudding mix, prepared
- 1 package (2 oz) dessert topping mix prepared

Prepare pudding mix according to instructions on package, using non-fat dry milk powder and water Split cake into three layers; spread ⅓ of filling on each of two layers. Prepare dessert topping mix according to instructions on package. Beat in remaining ⅓ of filling; frost top and sides of torte. Refrigerate before serving.

* * * *

LEMON VELVET PIE

- 1½ cups sugar
- 6 tablespoons cornstarch
- ¼ teaspoon salt
- 1½ cups boiling water
- 3 eggs, separated
- 2 tablespoons butter
- 1 tablespoon grated lemon peel
- ⅓ cup strained fresh lemon juice
- 1 teaspoon vanilla
- 1 envelope unflavored gelatine
- ¼ cup cold water
- 1 cup light cream
- 1 baked 9-inch pie shell
- 1 cup heavy cream, whipped
- 6 to 8 walnut halves

In saucepan, thoroughly mix together sugar, cornstarch and salt, add boiling water, stirring constantly. Bring to a boil over medium heat. Continue stirring; boil 3 to 4 minutes. Beat yolks slightly; add some of hot mixture to yolks, blending well Return to saucepan; add butter. Cook 2 minutes longer, stirring constantly Do not boil Remove from heat, stir in lemon topping Soften gelatine in water; add to hot mixture, stirring until thoroughly dissolved. Thoroughly blend in light cream Chill until slightly thickened, but not set Beat whites until stiff but not dry, carefully fold into chilled mixture Pour into your favorite baked 9-inch pie shell, chill until partially set Spread reserved filling completely over top of pie Chill until firm To serve, top with whipped cream and garnish with walnut halves.

* * * *

Lemon just naturally goes with fish —

FILLETS AMANDINE

- 1½ pounds fish fillets, fresh or frozen
- Salt and pepper
- ¼ cup butter or margarine
- ¼ cup blanched almonds.
- 1 tablespoon coarsely chopped onions
- 1 teaspoon grated lemon peel
- 2 tablespoons lemon juice
- Nutmeg

Thaw fish, if frozen; sprinkle with salt and pepper. Melt butter in large skillet; brown fish on both sides. In the meantime, place almonds and onions in electric blender; cover and blend several seconds or until chopped. (If blender is not available; chop very fine with knife.) Spoon almonds and onions over fish in skillet; add lemon peel and juice. Heat several minutes. Sprinkle with nutmeg 5 to 6 servings.

* * *

EASY HOLLANDAISE SAUCE

- ½ cup butter, cut into small pieces
- 3 egg yolks
- 3 tablespoons fresh lemon juice

Combine all ingredients in top of double boiler; let stand at room temperature for one-half hour Just before serving, place over gently boiling water for 1½ minutes, stirring briskly. Serve immediately over freshly cooked asparagus, carrots, broccoli or artichokes.

There's enough gold in suspension in the seas of the world to make every inhabitant of the world a millionaire—if only it could be recovered economically.

Farm Women 26 Hold Mother-Daughter Meet

The Society of Farm Women, Group No. 26, met at East Fairview Church of the Brethren on May 26th for a mother-daughter program. Hostesses were Mrs. Quentin Buckwalter, Jr., Mrs. Ralph Hostetter, and Mrs. Michael Grove, Jr.

At the meeting, conducted by Mrs. Nelson Hess, the Group voted to make favors for a rest home at the June meeting.

Entertainment consisted of a skit by Mrs. Clyde Buchen and her daughter, Debbie. Mrs. Lloyd Esbenshade and Mrs. Leroy Esbenshade showed a film.

The next meeting will be held at the home of Mrs. David Landis on June 29th.

Job Hunting Tips Offered For Teenagers

School's out! Is it going to be just another lazy summer in the sun or is this the year you go job-hunting?

Your chances of finding a job will be better if you prepare for the job interview, points out Miss Janet Reed, extension specialist at the University of Delaware. Remember, the employer wants to know how you can handle the job; his opinion of you will depend on your poise and appearance just as much as on your training and references.

Bring along a personal data sheet: include your name, address, telephone number, educational background, work experience, hobbies, occupational goals and references. Have your social security number with you, if possible.

Your appearance counts; **dress to please an adult, not your school crowd.** Even though wild, way-out clothes are "in" with your friends, your prospective employer will probably not be impressed — at least, not the way you want him impressed.

If you're a girl, wear a simply-styled dress, preferably with sleeves, and conservative jewelry that does not jingle. No pop-art kooky bracelets or dangly earrings Wear nylons and conservative, well-polished shoes without run-over heels Carry a small, neat handbag, save your shoulder-strap carry-all for the beach Keep your hands and hair well groomed and neat and go easy on the makeup Most businessmen believe eye-make up is out for the office — not "way-out", just out, period.

Miss Reed recommends teenage boys wear slacks with a conservative sports jacket, white shirt and tie. Wear polished business-type shoes, no moccasins and certainly not sneakers. Keep the neon-bright socks for after-job hours; wear socks that match your slacks for your interview.

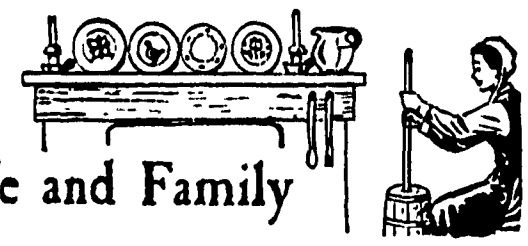
Boy's long hair is a sore point with most employers, unless they're hiring a rock-and-roll combo. In fact, boys may have to decide between getting a summer job and getting a decent haircut.

Neatness is necessary; some employers feel a prospective employee who doesn't have the self-discipline or intelligence to keep himself well groomed probably won't have the self-discipline needed to do the work.

If you're nervous, try to act as if you're not Sit still; don't fidget and **don't chew gum!** Try to give an impression of ability and self-confidence; the interviewer is interested in your attitude as well as your qualifications If you're still in high school, hunting for a job for the summer only, your skill and job qualifications mean very little compared to the immediate impression you make. That impression depends on how you look and act Looking neat may be for the squares, but the squares are "in" when it comes to getting a job.

Whenever a person starts resting on his laurels, he's likely to find it's made of poison ivy.

Why not put things off till tomorrow? Isn't that what it's for?



For the Farm Wife and Family

Ladies, Have You Heard? . . .

By Doris Thomas, Extension Home Economist

Selecting and Preparing Fresh Strawberries

Size has little relationship to the good qualities of strawberries. Variety, growing conditions, maturity, handling, care from vine to retail market, including length of time after harvest, all have as much or more to do with flavor than has size.

Strawberries will lose quality rapidly when left at warm temperatures

When you buy strawberries, as soon as possible refrigerate them unwashed and uncapped in a shallow tray.

Serve the berries soon after buying them — avoid prolonged storage.

If berries are slightly underripe, they'll continue to ripen in a cool dry place When ready to use, wash gently and quickly in cold water.

Lift berries lightly from water using your fingers as strainers, letting sand stay in the bowl.

Don't pour water directly on the berries.

Remove caps after the berries are clean and fairly dry Don't let them stand in water —it causes loss of color and flavor.

Throw Away Items You Don't Use

One way to relieve household clutter is to throw away —or give away items you no longer use This takes great will power, but it's worth it. One guide to help you decide which items to discard is If you haven't used the item within the last year or two, throw it out

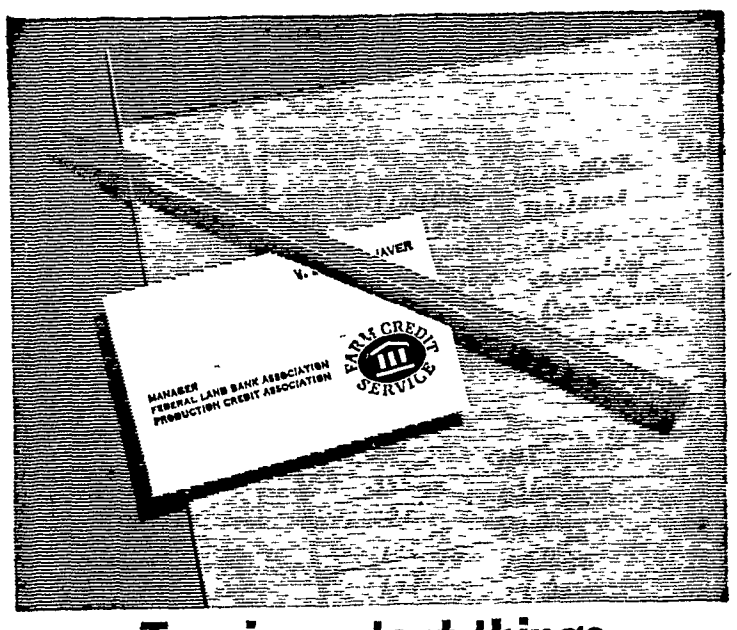
LANCASTER/LANDISVILLE/LITITZ/MANHEIM TOWNSHIP/MILLERSVILLE/ROHRERSTOWN

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION
A Trustee for The Lancaster County Foundation



Two important things when borrowing money

You need a sharp pencil plus the specialized financial advice of Farm Credit to determine how your financial needs can best be served. Farm production must be maintained, even increased if possible. Providing the financing to insure this is Farm Credit's job. Farm Credit loans are available now for any sound farm need. And, at realistic rates. Farm Credit interest is based on the unpaid balance of the loan. That saves you money.

Crop Roundup

Very favorable working conditions during the past 10 days enabled state farmers to put in long hours in an attempt to get caught up on spring field work, says the Pennsylvania Crop Reporting Service Accompaning the dry weather were higher temperatures which were very beneficial to the growth of all crops Soil moisture supplies are still adequate in all areas, but rain will be needed soon to maintain this condition

Corn planting, again the major activity made rapid headway in all areas Silo filling and hay making were major activities in many southern areas during that time Planting of potatoes, tomatoes, cabbage, sweet corn snap beans and other vegetables continued in all areas

GRAINS:

Corn planting has been completed on many farms throughout the state and is about 80 percent completed statewide Many early planted fields, which are up, are spotty and yellowish in color as a result of the cool weather this spring Some replanting may be necessary in several areas **Oats** planting is virtually completed throughout the state In nearly all areas oats are making excellent growth, with good stands and color. **Wheat** and **barley** continue to look good, with prospects for a good crop of each still in evidence Barley is nearly all headed in most areas with wheat just heading in the south

HAY:

Warmer weather improved the rate of growth of hay, but first cuttings may be lighter than normal in many areas Alfalfa weevil damage has been severe throughout much of the state, even where sprayed Stubble will be sprayed for weevil control on many farms.

PASTURE:

Pastures are now making good growth and are supplying a normal amount of feed in all areas Clipping has been noted in a few sections and should be active as soon as the more pressing work is accomplished.

POTATOES AND TOBACCO:

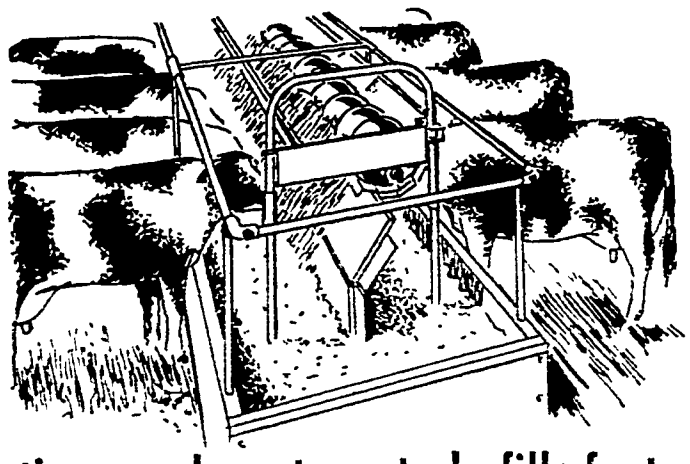
Planting of **fall potatoes** continued in all sections of the State, and is past the three quarter mark **Cobbler potatoes** are up, and are making better growth now. **Tobacco** made faster growth during the week as a result of the warmer weather. Transplanting was just getting underway on a few farms at the end of last week and should be active during the current week

VEGETABLES:

Strawberries are late in most areas, with picking just getting underway in York County. **Asparagus** cutting continues with much improved growth as a result of the warmer weather. **Tomato** planting continues in all sections. Freeze damage may hold acreage below intentions. **Lettuce** cutting is just getting underway **Green peas** are blooming in many sections, but harvest will be later than normal

YOU'VE GOT TO HAVE A SYSTEM—GO JAMESWAY POWER CHORING

BIG J
FILL-N-FEED SYSTEM



time-cycle automated—fills fast, feeds all at once, repeats

All your cattle get an even break at the feed bunk with a Jamesway Fill-N-Feed system. Feed separation is virtually eliminated because of the design. Hinged side pulls away from auger automatically to dump all feed at once. Economical manual dump also available. Capacity: 19½ tons of short-cut corn silage (72 per cent moisture) per hour. Feeds grain or silage.

● Prune In June

(Continued from Page 13)

are best pruned from mid to late June. By this time most of this year's growth has already taken place The effects of the pruning will last until next year, however, just enough new growth will occur to hide the pruning cuts

If it is necessary to remove large branches, paint wounds one and a half inches in diameter or larger with a tree wound dressing

Spring blooming shrubs can still be pruned this spring However, pruning in July or later will remove some of the flowering wood and reduce next springs bloom

Know what you intend to accomplish before you start pruning recommends Stevens Pruning is usually done to force side branches and flower buds to develop, to control the plant shape, to remove dead or diseased wood and to repair storm or winter damage

Shrubs such as forsythia will bloom year after year without pruning, but after a few years, they become a tangled mass Forsythia is best pruned by cutting out the old branches at the base of the plant New, healthy stems loaded with flower buds will replace them

Lilacs require a different treatment Stevens says Cut off the faded blooms before the seed pods develop When lilacs become too tall or lanky reshape the plants by cutting off the old, thick stems at the base of the plant Remove only a few old canes each year he warns, because plants may fail to bloom after a severe pruning

---

Prospects of all fruit crops are very unsettled, but peaches and sour cherries are very poor Wide variations in the stage of development exist even on single trees, and nothing will be certain until after the June drop

cluded dairy, steers, and market hogs. Daryl is the son of Mr. and Mrs. Warren Bollinger of Lititz R1. He plans to go directly into farming with his family on the home farm.

Jay Fisher — Manheim Central. Jay has served his local chapter as president and vice president, and held the post of sentinel in the county chapter last year. He was recognized Thursday night at graduation as the outstanding agriculture senior at Manheim. He has also received the Lancaster County Bankers and Manheim Farm Women awards. Most of his farming programs have revolved around swine breeding and fattening, and he has participated in the FFA county swine show and at the State Farm Show. In addition to his FFA work, he has also been busy in 4-H and school activities. The son of Mr. and Mrs. Jacob Fisher, Manheim R1, Jay has been accepted in the Penn State University two-year course in farm mechanics.

J. William Risser — Warwick. Bill has been president of his local FFA chapter, a candidate for County Star Farmer, and is a holder of the Keystone Degree. He was recently presented with the DeKalb Award. Bill has served as vice president of his class at Warwick for the past three years. He has played varsity basketball for three years, and was team co-captain this year He is the son of Mr and Mrs Robert B. Risser of Lititz R1, and plans to study business administration at Hagerstown Junior College in the fall.

Leonard E. Good — Garden Spot Leonard was this year's recipient of the DeKalb Award and the Leon M. Graybill Memorial Award. The latter is presented annually by the faculty to the outstanding agricultural student at Garden Spot, based on four year's activities It is in memory of a former vo-ag student, Graybill, who was killed in a tractor accident in 1960. Leonard is the son of Mr. and Mrs Leon W Good of East Earl R1 He has served as treasurer of his local chapter. He will join his father in the floor and wall covering business

Jacob L. Stoltzfus — Pequea Valley The DeKalb Award was presented to Jacob this year as PV's outstanding senior in agriculture He is a holder of the Keystone Degree, and has served as vice president of his FFA chapter. He placed 13th in the state last year in dairy judging, and has won many county livestock judging honors. He is a member of the wrestling and track teams at PV The son of Mr and Mrs. Leroy K Stoltzfus, Narvon R2, he plans to work with his father on the home farm.

Fred Kreider—Solanco Fred has been active in his FFA chapter in many capacities, including the office of vice president He received the Keystone Degree for 1966, and was presented with the DeKalb Award His farming program has included pigs, dairy, corn and other crops Fred plans to stay on the home farm and help his family expand its farming operation. He is the son of Mr. and Mrs. Fred Kreider of Quarryville R1.

Clayton Risser — Elizabethtown The son of Mr. and Mrs. Clayton Risser, Elizabethtown R3, Clayton will work on the

Water Bags Make Good Mulch, Researcher Says

Plastic bags filled with water and placed on the soil as a mulch improved vegetable yields by 20 percent on an experimental plot in Idaho, the U.S. Department of Agriculture reports.

The water mulch cut down on variations in soil temperature, absorbing some of the heat from the sun at midday and reducing heat loss from the soil at night. Most vegetables grow best within a fairly narrow range of soil temperatures, notes Sidney A. Bowers, soil scientist with USDA's Agricultural Research Service, who conducted the research. The Idaho Agricultural Experiment Station cooperated.

Bowers first tested his water mulch theory on uncropped soil. He found that the water bags reduced maximum temperature and increased minimum temperature in the half-inch of the upper soil's surface At a depth of 4 inches, the bags raised both maximum and minimum temperatures.

Bowers then tried the new mulching idea on two heat-sensitive crops: sweet corn and string beans. He planted 12 plots of each vegetable, four mulched with water bags, four with plain strips of plastic, and four without mulch. Average yields for sweet corn were, respectively, 28,000 pounds, 24,000 pounds, and 16,000 pounds per acre from the three treatments. Bean yields were 17,000 pounds, 14,000, and 9,000 pounds per acre.

The advantages of water mulch were best demonstrated during an unseasonable cold snap, Bowers said. One September day during the experiment, snow fell and air temperature dropped from the mid-40's to 24 degrees F. Minimum soil surface temperatures were 32 degrees F. on the unmulched plots, 36 degrees F. on the plots mulched with plastic strips, and 40.7 degrees F. on the water mulched plots. Bean plants on the unmulched and plastic-mulched plots froze down to the soil line; water-mulched beans froze only to the tops of the water bags—about four inches from the ground. Two weeks after the freeze, fresh beans were harvested from the water mulched plot.

Bowers used plastic bags made of 6-mil clear polyethylene, cut 12 feet long and two feet wide to fit between the rows on his 12 by 12-foot test plots. The bags were filled with enough water to swell them to a thickness of about four inches. The plastic-mulched plots were covered with strips of the same clear polyethylene. Golden Beauty sweet corn and Garden Green bush beans were used in the experiment. [illegible] pounds of nitrogen per [illegible] was disked into each plot [illegible] to planting. Thermocouples were buried at varying depths in the plots to record soil temperature.

Water mulches would allow gardeners to plant early in the spring with less risk of frost damage, and should be especially useful in regions where temperature varies sharply during the growing season, scientist believe.

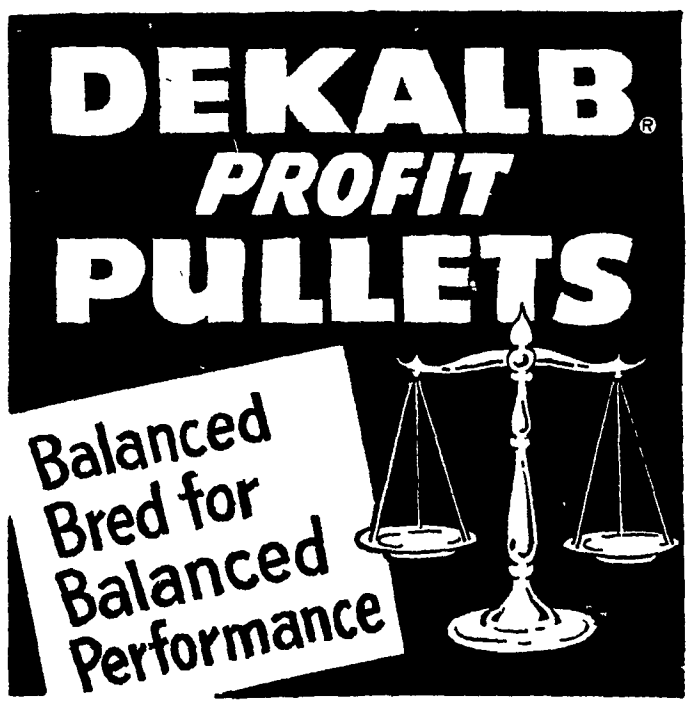
● Outstanding Seniors

(Continued from Page 18)

home farm. He was cited at his high school's commencement exercises this week as the outstanding graduating agriculture senior, receiving the Elizabethtown Farm Women's award. He has served his FFA chapter as corresponding secretary. Although Clayton's main farming interest is dairy, his work experience program this year was spent in the employ of a local farm machinery dealer.

Our congratulations to all of these boys on their outstanding efforts during their agricultural schooling. College-bound, or farm-bound — good luck!

DEKALB® PROFIT PULLETS



DeKalb Layers are BALANCED BRED for the SIX PROFIT FACTORS that make for success in your poultry operations—High Livability—Longevity of Lay—High Egg Production—Top Interior Egg Quality—High Feed Efficiency—Superior Shell Strength and Proper Egg Size.

LIVABILITY
HIGH PRODUCTION
"DEKALB" is a Registered Brand Name. Numbers are Variety Designations.

Dangers In Delaying World Food & Agricultural Development Noted

UNIVERSITY PARK—Two College of Agriculture faculty members at Penn State University warned recently of the danger of delaying agricultural development efforts in areas of the world where food is becoming scarce.

As population exceeds the ability of a nation to produce foodstuffs, the cost of increasing food production rises considerably, declared Wayne A Schutjer, economist, and Russell B Dickerson, coordinator of international agricultural programs for the College of Agriculture

"It is extremely difficult and expensive to conduct agricultural development programs where seed grain must be used to avoid starvation or where manure must be burned for fuel rather than being used as fertilizer," they stated

Their comments were featured during a seminar held as part of a new program of international agricultural development in the College of Agriculture Under the program, projects of technical assistance involving research and education are already underway in Argentina and India

Schutjer suggested that United States aid policy should be tailored to fill gaps in the existing resources of nations receiving aid This might vary among items such as new plant varieties population control clinics, fertilizer credit or food aid

"While opinions differ on the severity of the world food situation and the adequacy of resources and technology to solve the problem, most persons agree that mankind is involved in a race between the stork and the plow and that a war on hunger must be waged," he affirmed.

To bring population and food supply into balance, the speakers called for combined use of population control, increased agricultural production, and a more complete utilization of current production in countries where supplies are limited

How successful these methods will become in solving food problems will depend upon the long-term efforts of the individual nations, they said Supplies of grain and other food available from the United States and other nations with adequate diets should be considered only supplementary in meeting food shortages

Sounding an optimistic note, they indicated history shows that nations facing food shortages have overcome the Malthusian dilemma of population outgrowing the food supply They predicted many nations currently considered as having inadequate diets will reach this stage of development within the coming decade

Having overcome food shortages, nations will develop programs designed to improve the material well being of their people they concluded

● Have You Heard

MARKET EGG PRODUCERS

EFFICIENCY PAYS

DO YOU KNOW THAT:

- A 12½% reduction in feed required per dozen eggs equals a saving of approximately $350.00 per 1000 hens.
- That our Early Bird All Mash Laying Feeds will definitely produce BETTER SHELL QUALITY over the laying year?
- That each ½% improvement in breakage can improve your income by $36.00 per 1,000 hens housed?
- A price improvement thru BETTER GRADE of ½ cent per dozen amounts to approximately $100.00 per 1,000 hens housed?
- If your feeding program gives you 1% better hen house liveability and ½ dozen more eggs per hen housed, it can mean as much as $175.00 extra return per 1000 hens?
- That GOOD records pay big dividends? Without accurate records you CAN NOT fairly judge the value of your program?
- That it's not the START, it's the FINISH that counts.
